Hand washing is a simple habit — one that requires minimal training and no special equipment. Yet it's one of the best ways to avoid getting sick. This simple habit requires only soap and warm water or an alcohol-based hand sanitizer — a cleanser that doesn't require water. Do you know the benefits of good hand hygiene and when and how to wash your hands properly?

The dangers of not washing your hands
Despite the proven health benefits of hand washing, many people don't practice this habit as often as they should — even after using the bathroom. Throughout the day you accumulate germs on your hands from a variety of sources, such as direct contact with people, contaminated surfaces, foods, even animals and animal waste. If you don't wash your hands frequently enough, you can infect yourself with these germs by touching your eyes, nose or mouth. And you can spread these germs to others by touching them or by touching surfaces that they also touch, such as doorknobs.

Infectious diseases commonly spread through hand-to-hand contact include the common cold, flu and several gastrointestinal disorders, such as infectious diarrhea. While most people will get over a cold, the flu is much more serious. Some people with the flu, particularly older adults and people with chronic medical problems, can develop pneumonia. The combination of the flu and pneumonia, in fact, is the seventh leading cause of death among Americans.

Inadequate hand hygiene also contributes to food-related illnesses, such as salmonella and E. coli infection. According to the Centers for Disease Control and Prevention, as many as 76 million Americans contract a food-borne illness each year. Of these, about 5,000 die as a result of their illness. Others experience the annoying symptoms of nausea, vomiting and diarrhea.

Proper hand-washing techniques
Good hand-washing techniques include washing your hands with soap and water or using an alcohol-based hand sanitizer. Antimicrobial wipes or towelettes are just as effective as soap and water in cleaning your hands but aren't as good as alcohol-based sanitizers.

Antibacterial soaps have become increasingly popular in recent years. However, these soaps are no more effective at killing germs than are regular soap and water. Using these soaps may lead to the development of bacteria that are resistant to the products' antimicrobial agents — making it even harder to kill these germs in the future. In general, regular soap is fine. The combination of scrubbing your hands with soap — antibacterial or not — and rinsing them with water loosens and removes bacteria from your hands.
Proper hand washing with soap and water
Follow these instructions for washing with soap and water:

- Wet your hands with warm, running water and apply liquid or clean bar soap. Lather well.
- Rub your hands vigorously together for at least 20 seconds.
- Scrub all surfaces, including the backs of your hands, wrists, between your fingers and under your fingernails.
  - Rinse well.
  - Dry your hands with a clean or disposable towel.
  - Use a towel to turn off the faucet.

Proper use of an alcohol-based hand sanitizer
Not all hand sanitizers are created equal. Some "waterless" hand sanitizers don't contain alcohol. Use only the alcohol-based products.

- Apply about 1/2 tsp of the product to the palm of your hand.
- Rub your hands together, covering all surfaces of your hands, until they're dry. If your hands are visibly dirty, however, wash with soap and water rather than a sanitizer.

When should you wash your hands?
Although it's impossible to keep your bare hands germ-free, times exist when it's critical to wash your hands to limit the transfer of bacteria, viruses and other microbes.

Always wash your hands:

- After using the bathroom
- After changing a diaper — wash the diaper-wearer's hands, too
- After touching animals or animal waste
- Before and after preparing food, especially before and immediately after handling raw meat, poultry or fish
- Before eating
- After blowing your nose
- After coughing or sneezing into your hands
- Before and after treating wounds or cuts
- Before and after touching a sick or injured person
- After handling garbage
- Before inserting or removing contact lenses
- When using public restrooms, such as those in airports, train stations, bus stations and restaurants.
**Kids need clean hands, too**

You can help your children avoid getting sick by insisting that they wash their hands properly and frequently. To get kids into the habit, teach by example. Wash your hands with your children and supervise their hand washing. Place hand-washing reminders at children's eye level, such as a chart by the bathroom sink for children to mark every time they wash their hands. Tell your children to wash their hands for as long as it takes them to sing their ABCs, "Row, Row, Row Your Boat" or the "Happy Birthday" song. This works especially well with younger children, who may rush when washing their hands.

Older children and adolescents also can use alcohol-based hand sanitizers. Younger children can use them, too — with an adult's help. Just make sure the sanitizer has completely dried before your child touches anything. This will avoid ingestion of alcohol from hand-to-mouth contact. Store the container safely away after use.

Hand washing is especially important for children who attend daycare. Children in daycare are at greater risk of gastrointestinal diseases, which can easily spread to family members and others in the community.

To protect your child's health, be sure your daycare provider promotes sound hygiene, including frequent hand washing or use of alcohol-based hand sanitizers. Ask whether the children are required to wash their hands several times a day — not just before meals. And make sure the sink is low enough for children to use, or that it has a stool underneath so that children can reach it. Note, too, whether diapering areas are cleaned after each use and whether eating and diapering areas are well separated.

**A simple way to stay healthy**

Hand washing doesn't take much time or effort, but it offers great rewards in terms of preventing illness. Resolve today to adopt this simple habit as a way to help protect your health.
